The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidate rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumnour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or or thomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                                                                        Vaccine; cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; tungal infection; parasitic infection; cancer; asthma; infection; datasitic infection; cancer; asthma; and infections disease; allergy; immune deficiency; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vaccinating against tumors, infectious diseases, allergies and asthmausing immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention relates to methods for treating or preventing developing administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder ancer, bone cancer, barin and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, Hodgkin's lymphoma, non-Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, larynx cancer, pancreatic cancer, prostate cancer, rhaddomyosarcoma, skin cancer, prostate cancer, rhaddomyosarcoma, skin cancer, stonach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of the invention
                                                                                                                                                                         Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunostimulatory, antiinflammatory, dermatological, antipsoriatic, antiulcer; gene therapy, vaccine, non-allergic inflammatory disease, psoriasis, eczema, allergic contact dermatitis, latex dermatitis; inflammatory bowel disease, ulcerative colitis, Crohn's disease; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   administering at least one antianglogenic nucleic acid molecule. Also nichluded is a kit comprising a first container housing the antianglogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted anglogenesis. The method is useful for inhibiting anglogenesis associated with solid tumour growth, tumour metaetasis, precencerous lession, theumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler webber Syndrome, myocardial anglogenesis, plaque neovascularisation, telanglectasia, haemophiliac joints, anglofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hypertrophic scars. The present sequence is an antianglogenic nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprising
rubeosis; Osler-Webber Syndrome; myocardial angiogenesis;
plaque neovascularisation; telangiectasia; haemophiliac joint;
angiofibroma; wound gramulation; intestinal adhesion; atherosclerosis;
scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The methods and compositions of the present invention are useful for diagnosling and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                        The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulocrative collits or Crohn's disease. This sequence represents an immunostimulatory nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including thinitis, urticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose

                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                      The signal sequence was isolated from barley alpha-amylase cDNA by PCR using the primers given in AAQ86577-78. The product was cloned into BBLUBSCTIPILI together with a mouse MHC II alpha chain mature peptidenenceing sequence to obtain plasmid pSM155, for expression in tobacco cv. SRI transformants. The present invention describes a filamentous fungus (I) comprising an exogenous polynucleotide capable of expressing a Bcl-2 polypeptide or its active portion, and exhibiting accelerated growth as compared to a wild-crype filamentous fungus. Also described: (1) enhancing (M1) growth of filamentous fungus. Involving providing the filamentous fungus with a Bcl cilamentous fungus; (2) enhancing (M2) the viability and/or pathogenicity of a filamentous fungus stored at sub-optimal temperature; (3) increasing (M3) the resistance of a filamentous fungus to stress; (4) a fungal collumentous fungus stored at sub-optimal temperature; (3) increasing (M3) the resistance of a filamentous fungus comprising Bcl-2 culture medium (II) suitable for growth of fungus, comprising Bcl-2 culture medium (II) suitable for growth of fungus, comprising Bcl-2 culture medium (II) suitable for growth of fungus, comprising Bcl-2 culture medium (II) suitable for growth of fungus, comprising Bcl-2 colletotrichum gloeosporioides f.sp. aeschynomene. (M1) is useful for eradicating an unwanted weed growing in a crop field, which involves correspondention, paper and prupindustry apprassion and pulp industry applications, such as food and drug production, paper and pulp industry agriculture and confidention. (I) remains viable in storage for a time period longer than the wild-type filamentous fungus when grown on solid media. (I) stress, as compared to the wild-type filamentous fungus. The present culture are exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                Novel filamentous fungus having exogenous polynucleotide expressing Bcl-2 polypeptide, and exhibiting accelerated growth compared to wild- type filamentous fungus, useful for eradicating unwanted weed growing in crop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to the use of apoptotic genes in the the production of transgenic plants with improved resistance characteristics. The present sequence is the mutagenic PCR primer Bc12-5. This primer was used with primer Bc12-3 (AAA48985) to introduce a 5' Ncol site and a 3' Xbal site in the human apoptotic gene bc1-2. Specifically the primer introduced an Ala residue between the Met (position 1) and His (position 2) residues of the native protein. The altered bc1-2 sequence was used in the creation of the final vector used to transform plants. The improved resistance characteristics of the plants helps protect against bacterial, viral and other pathogens. Resistance to abiotic challenges may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid regulatory sequences, which are able to regulate expression of a gene operably linked to a promoter, useful for regulating the expression of transgenes and for treating e.g., cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present 5' primer was used with the 3' primer given in AAA50260 for the PCR amplification of Bel2 DNA, introducing a 5' BaiMI site and a 3'

Nhel site. The PCR product was incorporated into an episome to demonstrate a method of the invention. The method relates to the maintenance and selection of episomes in transfected eukaryotic cells in viron or in vivo, e.g. for gene therapy. It involves transfecting the cells with an episome under conditions in which cells that survive are successfully transfected with the episome. The resulting cells express a first protein whose expression causes cell death and a second protein whose expression causes cell death and a second protein whose expression and each of the first protein. In an example of the method, bcl2 and bad, and dff45 and first protein. In an example of the method allows the rapid establishment used to transfect 293E cells. The method allows the rapid establishment of eukaryotic cells that stably and reliably express a gene of interest
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                Stably transfecting eukaryotic cells with at least one episome for the production of a desired protein in vitro and for gene therapy.

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunos response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
              Vaccinating against tumors, infectious diseases, allergies and asthmausing immunostimulatory Py-rich and TG nucleic acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            a
                                                          The invention describes an isolated nucleic acid regulatory sequence for a cyclin DI promoter, a CD40L promoter, vancomycin-resistant enterococci (VRE) promoter, and TRA promoter, human epidermal growth factor receptor 2 (HER2) promoter, or a beta lactamase regulate expression of the endogenous, autologous or heterologous genes operably linked to the promoter, and may be incorporated into heterologous nucleic acid constructs for use in regulated expression of transgenes. Regulated expression of cyclin DI can be used in cancer therapies, such as breast, colon or pancreatic cancers and familial adenomatous polyposis. Regulation of the activity of CD40L gene promoter may be used in the treatment of immunological disorders, such as uctoimmune diseases e.g. multiple sclerosis (MS), systematic lupus erythematosus (SLE), graft-ve-host disease (GVHD) and rhematoid autoimmune diseases e.g. multiple sclerosis (MS), systematic lupus erythematosus (SLE), graft-ve-host disease (GVHD) and rhematoid arthitis. Regulated expression of genes under the control of the HBV (hepaticis B)-specific core, pre-S and X promoters can be used in the therapy of HBV disease, chronic hepatic insufficiency, cirrhosis, hepatocellular carcinoma, and in the regulated expression of the androgen receptor gene can be used in the treatment of Enterococcus infection, while regulated expression of the androgen receptor gene can be used in the invention to determine the regulatory regions involved in gene expression, collectine corribed in the method of the invention may are promoter region used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour, viral infection; bacterial infection; fungal infection, parasitic infection, cancer, asthma, infections allergy, immune deficiency, phosphorothioate; ss.

               included is a kit comprising a first container housing the antianglogenic included is a kit comprising a first container housing the antianglogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, dabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler Webber Syndrome, myocardial angiogenesis, plaque meovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oseophageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, kidney cancer, larynx Hodgkin's lymphoma, melanoma, melanoma, cancer, rabdomycaarcoma, skin cancer, pancreatic cancer, postate cancer, rhabdomycaarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnoshing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                         Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.

The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in manitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific cutations of any gene, in mapping the 5' termini of mRNA molecules by crimate extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence date for this patent can also be obtained in electronic format directly from USPTO at sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fas-associated protein; tumour necrosis factor receptor; PTP-BAS; apoptosis; PAP; cell surface protein; autoimmune disease; HIV virus; hybridoma; cell death; DNA primer; PCR; polymerase chain reaction; s

New Fas associated proteins PTP-BAS types 4 and 5 - involved in

```
the signal sequence causing a transmembrane transport of the nucleic acid in a biological system. The invention also relates to a vector containing the nucleic acid and a biological system. The invention also relates to a vector containing the nucleic acid, a host organism containing at least the nucleic acid or the vector, a method of producing the nucleic acid, the vector, a pharmaceutical composition comprising the nucleic acid, the vector or the host organism and optionally a pharmaceutical carrier and/or diluent and a kit comprising the nucleic acid, the vector or the host organism and optionally a pharmaceutical carrier and/or diluent and a kit comprising the nucleic acid, the vector or the host organism. The nucleotide sequence further contains at least one second nucleotide acquainted and/or one or mare components accordently linked and/or second nucleotide sequence, where the covalently linked and/or second nucleotide sequence. Where the covalently linked and/or complexed components are biologically active. The nucleic acid, vector or host organism is useful for preparing a pharmaceutical composition for treating genetically based disorders. This sequence represents a signal sequence-containing
                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                      for
programmed cell death, used for modulating apoptosis, e.g. for treating cancer, and for identifying other modulators.
                                                                                              The cDNA sequence encoding the cytoplasmic domain of human Fas (AA 191-335) was modified by PCR mutagenesis using this primer along with the corresponding reverse primer (AAT18389) and another forward (AAT18386) and reverse (AAT18337) primer set. It was then subcloned in frame into plasmid pEG202 to produce plasmid pEG/Fas(191-135). The cDNA sequence the cytoplasmic domain of human Fas was then subcloned into the ECORI site of pEG202, in-frame with the upstream LexA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a nucleic acid comprising a first nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a nucleic acid comprising a first nucleotide sequence having at least one signal sequence unit or a mixture of units, the signal sequence causing a transmembrane transport of the nucleic acid in a biological system. The invention also relates to a vector containing the nucleic acid, a host organism containing at least the nucleic acid or the vector, a method of producing the nucleic acid, the vector, a pharmaceutical composition comprising the nucleic acid, the vector or the host organism and optionally a pharmaceutical carrier and/or diluent and a kit comprising the nucleic acid, the vector or the host organism. The nucleotide sequence further contains at least one second nucleotide sequence further contains at least one second nucleotide sequence to be transported and/or one or more components covalently linked and/or second nucleotide sequence. Where the covalently linked and/or complexed components are biologically active. The nucleic acid, vector or host organism is useful for preparing a pharmaceutical composition for treating genetically based disorders. This sequence represents an oligonucleotide used in the scope

                                                                                                               The invention relates to a novel expression vector comprising an enhancer sequence and a reporter gene. The enhancer sequence comprises a variable number of tandem repeat (VWTR) and is found in the 3' non-coding region of the human dopamine transporter (DAT) gene. The enhancer sequence is capable of promoting the transcription of the reporter gene. An expression vector of the invention has antiparkinsonian, neuroleptic, and antidepressant activity, and may act as a dopamine transporter gene expression vector is useful for identifying a compound capable of regulating the expression of a target gene (preferably human dopamine transporter gene) that comprises an enhancer sequence. A compound of the transporter gene) that comprises an enhancer sequence. A compound of the transporter gene) that required parkinson's disease and schizophrenia that are associated with reduced and increased levels of dopamine, respectively. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, or at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The morphisms, or family members of a gene and a cross-species comparises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening CDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been containing sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence thm!
                                                                                                                                                                                              New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     therapeutic protein production, characterized by the utilization of sequence motifs for restriction endonucleases NotI or NcoI to connect the gene segments (including promoter regulatory regions) with the gene segments (including structural fragments of the gene coding the required protein). The method is useful for preparing an expression vector for therapeutic protein production, in particular human erythropoietin (BPO). The vector produced by the method is useful for BPO expression in suitable transfected eukaryotic cells or in the mammary gland of transgenic organisms. The present sequence represents a translational consensus WAP-EPO sequence with NotI modification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the preparation of an expression vector for the

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence date for this patent can also be obtained in electronic format directly form the directly of the microarray.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                 New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human; cross-species comparison.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its configuration, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific or probes is useful in in situ hybridisation, in Southern, Northern or dotor hybridisation to identify or detect the sequence or specific or mutations of any gene, in mapping the 5' termini of mRNA molecules by cylmer extensions or in screening solwa or genomic libraries or subclones or solational subclones containing segments of DNA that have been consolated in netering or the sequence presented is one of the concleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence thml
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                               New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                             The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, or at least one target sequence. The method of analysis comprises compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises in hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the cucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific or mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the containing patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                      New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present sequence is a PCR primer used to amplify the EGF sequence in COS cells infected with non-targeted M13 phage and EGF-phage. The maplification primers have sequences located on each side of the EGF sequence in the gene III coding sequence. The PCR products were digested with restriction endonucleases and ligated into a new phage vector and used to transform competent bacterial cells by electroporation. Plaques cover analysed via PCR using oligonucleotides which included the present sequence. Four rounds of selection were sufficient to enrich the targeted EGF-phage to 100%. This selection procedure is a useful example of a novel method of selecting internalising ligands displayed on a genetic package carries a gene encoding a detectable product expressed on internalisation. The method is referred to as Ligands Ingands that may be useful as antibacterial agents or in gene therapy. The method is also useful for studying protein interactions that the ligands.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                   The invention relates to a method for selecting ligands that internalise and facilitate transgene expression, comprising displaying on a phage carrying a transgene encoding a detectable product, and recovering a nucleic acid molecule encoding the ligands from the cell expressing the detectable product. The methods are useful in selecting and identifying ligands displayed on a phage that internalise and facilitate transgene expression, and also in identifying transduction facilitating peptides. Internalising ligands identified by the methods are useful in gene delivery methods and as anti-bacterial agents. The ligands and anti-ligands identified by the treatment of e.g., cancer and restenosis. The method is also useful in that it allows identification of molecules that are targets for new discovery. This sequence represents a PCR primer used to amplify a ligand gene III fusion of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CpG immunostimulatory oligonucleotide; immune response; allergy; asthma;

                                                                                                                       The invention relates to a class of CpG immunostimulatory oligonucleotides containing a 5'TCG motif or a CG at or the 5' end that care useful for stimulating an immune response. Oligonucleotides and compositions of the invention are useful for treating allergy or asthma, viral and bacterial infections and cancer e.g. biliary tract cancer, breast cancer, cervical cancer, choriocarcinoma, colon cancer, endometrial cancer, gastric cancer, hyphomas, intraepithelial neoplasms, liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma, neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer, rectal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer, new CNS cancer, connective tissue cancer, oesophageal cancer, eye cancer, testicular cancer, as well as other carcinomas and asrcomas. The invention is also useful in gene therapy. The present sequence is a CpG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CpG immunostimulatory oligonucleotide; immune response; allergy; asthma; viral infection; bacterial infection; cancer; lymphoma; intraepithelial neoplasm; melanoma; neuroblastoma; Hodgkin's lymphoma; carcinoma; sarcoma; gene therapy; phosphorothioate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                         ö
                                                The invention relates to a class of CpG immunostimulatory of objigonucleotides containing a 5TCG motif or a CG at or the 5' end that are useful for stimulating an immune response. Oligonucleotides and compositions of the invention are useful for treating allergy or asthma, viral and bacterial infections and cancer e.g. biliary tract cancer, breast cancer, cervical cancer, choricoarcinoma, colon cancer, endometrial cancer, gastric cancer, invaphomas, intraepithelial neoplasms, liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma, neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer, rectal cancer, sarcomas, thyroid cancer, renal cancer, brain and CNS cancer, connective tissue cancer, oesophageal cancer, eye cancer, testicular cancer, as well as other carcinomas and asrcomas. The invention is also useful in gene therapy. The present sequence is a CpG invariant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a method of regulating apoptosis in a cell comprising targeting an abnormally or alternatively spliced mRNA, an abnormally or alternatively structured mRNA, or a product of either. Also described are: a nucleotide construct with a nucleotide sequence which is homologous to mRNA transcribed from an abnormally spliced gene; an agent selected from small molecule or protein; polypeptide; peptide; aptamer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Regulating apoptosis in a cell, useful for treating cancer, comprises targeting an abnormally or alternatively spliced mRNA, an abnormally or alternatively structured mRNA, or a product of either.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic; gene therapy; apoptosis modulation; pharmaceutical; cancer; cytostatic; neoplasm; Bcl-2; reverse transcriptase PCR; RT-PCR; primer;

performant for the treatment of cancerous cell growth; a pharmaccutical composition comprising a nucleotide construct such as siRNA, anti-sense RNA, shrNA or markNA, or the agent cited above, and a pharmaccutical composition comprising a nucleotide construct such as siRNA, anti-sense RNA, shrNA or markNA, or the agent cited above, and a pharmaccutical cilluent or carrier; a DNA or RNA expression vector comprising an cilluent or carrier; a DNA or RNA expression vector comprising an uncleic acid sequence of the abnormally spliced gene element as given in the specification; a nucleic acid molecule which hybridizes to the nucleic acid sequence of (a); and a nucleic acid molecule which has a nucleic acid sequence which is degenerate because of the genetic code to the sequences in (a) and (b) and any sequence which is complementary to the above sequences, where the expression cassette is transcriptionally linked to a promoter sequence. The method is useful for regulating apoptosis in a cell or for treating cancer. The agent or nucleotide construct is useful as a medicament of the manifacture of a medicament for the treatment of cancerous cell growth. In addition, the nucleotide construct is a means for silencing the expression of an abnormally spliced gene for use as a medicament for treating cancerous cell growth. The DNA or RNA expression vector is used as a delivery means for a molecule that is used in the targeting of an abnormally spliced mile and the targeting of an abnormally spliced spliced spliced or represents and a reverse transferior entering the account of the angle of the angle or the plant or represents and and and and the plant of the targeting or reserved the plant or the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a PCR primer that was used to amplify DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide specific for pathogenic Neisseria useful in therapeutic or preventative vaccines and for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pathogenic strain; Neisseria; vaccine; Neisseria infection; PCR primer;

ö
encoding a protein that is specific for pathogenic strains of Neisseria. The polynucleotides, polypeptides, or their antigenic fragments, are used in vaccines to treat or protect against Neisseria infections, particularly by N. meningitidis. The polynucleotide sequence is also used for recombinant production of the polypeptide and to produce attenuated Neisseria strains that overexpress it, or express it in a non-toxic

The present invention describes a synthetic composition, which comprises collagen, fibronectin and at least one cell. Also described are: (1) a construct prepared by a method (MI) comprising; (a) preparing a solution comprising collagen and fibronectin; (b) suspending endothelial cells in the solution of step (a), where the suspended endothelial cells in the solution of step (a), where the suspended endothelial cells comprise a nucleic acid encoding a capsase-resistant Bel-2 polymetries, and (C) polymerising the collagen within the solution of step (b) to form a three construct produced by the method of [1]; (3) a method (M2) of a method (M3) for forming endothelial cells into tubbes within a comparint; (4) a method (M3) for producing endothelial cell tubules in vivo; (5) a method (M3) of producing endothelial cell tubules in vivo; (5) a method (M3) of producing endothelial cells into tubbes within a corresponded in the process of vascularisation; (7) a method (M7) of corrior in an argent, which modulates vascularisation or vascular cremodeling; and (8) the endothelial cell tubules produced by the method of (M4). The synthetic composition has vascuropic activity. The composition is useful in methods for forming cultured endothelial cells into tubes within a confinence-dimensional gel. This is partcularly, useful in the grafting of three-dimensional gel. This is partcularly, useful in the grafting of engineered skin onco recipients with impaired vascularisation or impaired caraftengered skin onco recipients with impaired vascularisation and organitarion and caraftengered in an example from the present invention
```

comprise a nucleic acid encoding a caspase-resistant BC1-2 polypeptide, adjusting the solution of step (b) to about pH 7.0-8.0, and warming the solution of step (c) to about 25-40 °c; C to form a three-dimensional gel. The method of endothelial cell transplantation promotes wascularisation of human skin equivalents in vivo. Administration can be orthotopic or subcutaneous. The engineered human skin equivalents and methods are useful in treating diseases or conditions involving impaired angiogenesis, such as diabetes, chronic leg ulcers, wounds, cardiovascular disease or burnis. The present sequence represents a Caspase-resistant BC1-2 5'-end terminal fragment

Sequence 31 BP; 7 A; 10 C; 8 G; 6 T; 0 U; 0 Other;

The invention relates to an engineered human skin equivalent, where the skin equivalent becomes perfused in vivo after engraftment on an immunodeficient animal. The method involves implanting onto a skin surface wound of an animal a construct prepared by a method comprising: preparing a solution comprising collagen and fibronecth; suspending endothelial cells in the solution where the suspended endothelial cells

cells,

New synthetic composition comprising collagen, fibronectin and useful for forming cultured endothelial cells for tissue/organ transplantation or grafting onto recipients with impaired

The invention relates to a hybrid oligomer comprising a cyclic AMP response element (CRE) sequence and a sequence that hybridises to the bcl response element (CRE) sequence and a sequence that hybridises to the bcl 2 pre-mRNA or mRNA. Also included are: (1) inhibiting the growth off cancer cells in vitro, which comprises contacting the cancer cells with a tybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer. (2) treating or preventing cancer in a human, which comprises and a CRE decoy oligomer a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer and (3) a pharmaceutical composition comprising a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer and (3) a pharmaceutical composition of the invention is useful for preventing or treating cell-proliferative disorders e.g., cancer, byperplasia or tumourigenesis and also bacterial infection, viral infection, inflammation, anaphylaxis, allergy, arthritis, asthma, autoimmune disorders and parasitic infection. The CRE decoy oligomer and bcl-2 antisense oligomer are also useful for preventing or treating captening candidate transcription factors or other molecules e.g., gene screening candidate transcription factors or other molecules e.g., gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for diagnostic assays. The invention relates to a hybrid oligomer comprising a cyclic AMP response element (CRE) sequence and a sequence that hybridises to the bcl 2 pre-mRNA or mRNA. Also included are: (1) inhibiting the growth of cancer cells in vitro, which comprises contacting the growth of cancer cells in vitro, which comprises contacting the cancer cells with a cancer cells in vitro, which comprises oligomer and a CRE decoy oligomer; (2) treating or preventing cancer in a human, which comprises administering a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer; and (3) a pharmaceutical composition comprising a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer and a CRE decoy oligomer; The pharmaceutical composition of the invention is useful for carrier. The pharmaceutical composition of the invention is useful for preventing or treating cell-proliferative disorders e.g., cancer, hyperplasia or tumourigenesis and also bacterial infection, viral infection, inflammation, anaphylaxis, allergy, arthritis, asthma, autoimmune disorders and parasitic infection. The CRE decoy oligomer and bcl-2 antisense oligomer are also useful for preventing or treating cancidate transcription factors or other molecules e.g., gene creening candidate transcription factors or other molecules e.g., gene creening candidate transcription assays. The present sequence is a Bcl-2 antisense oligomucleotide
                                                                                                                                                                                                                                                                                          Antisense; ss; probe; Bcl-2; cell proliferative disorder; cancer; CRE; cAMP response element; bacterial infection; viral infection; inflammation; anaphylaxis; allergy; arthritis; asthma; cytostatic; autoimmune disorder; parastic infection; virucide; hyperplasia; tumourigenesis; hepatitis B infection; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hybrid oligomer comprises a cyclic AMP response element sequence and sequence that hybridizes to the bcl-2 pre-mRNA or mRNA useful for preventing or treating cell-proliferative disorders e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "Phosphorothioate backbone"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a hybrid oligomer comprising a cyclic AMP response element (CRE) sequence and a sequence that hybridises to the 2-2 pre-mRNA or mRNA. Also included are: (1) inhibiting the growth of cancer cells in vitro, which comprises contacting the cancer cells with hybrid oligomer or a bol-2 antisense oligomer and a CRE decoy oligomer; (2) treating or preventing cancer in a human, which comprises administering a hybrid oligomer or a bol-2 antisense oligomer and a CRE decoy oligomer, and (3) a pharmaceutical composition comprising a hybrid oligomer or a bol-2 antisense oligomer and a cRE decoy oligomer and a carrier. The pharmaceutical composition of the invention is useful for preventing or treating call-probliferative disorders e.g., cancer, hyperplasia or tumourigenesis and also bacterial infection, viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 infection, inflammation, anaphylaxis, allergy, arthritis, asthma, autoimmune disorders and parasitic infection. The CRE decoy oligomer and bcl.2 antisense oligomer are also useful for preventing or treating hepatitis B virus infection. The hybrid oligomers can also be used for screening candidate transcription factors or other molecules e.g., gene regulatory proteins or for diagnostic assays. The present sequence is a Bcl-2/CRE hybrid antisense oligomucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hybrid oligomer comprises a cyclic AMP response element sequence and a sequence that hybridizes to the bcl-2 pre-mRNA or mRNA useful for preventing or treating cell-proliferative disorders e.g., cancer.

receptor. Specifically, it comprises transformation of endocrine cell lines originating from mammalian hypothalamus and pancreatic islets, culturing the transformants and contacting with cells expressing the transformants and contacting with cells expressing the target receptor. The identification of those cells with a response reaction can be used for selecting a transformant cell line with the appropriate target activity that is expressing the novel transformed DNA. Accordingly, the present invention describes novel cell lines that are applicable in expression cloning systems of bloactive peptide precursor genes, and in screening GPCR ligands for use as drugs including agonists, antagonists and invesse agonists i.e. activators and inhibitors. Such cell lines can provide a highly enemative and convenient GPCR ligand assay system. This oligonucleotide sequence is a PCR primer used to amplify human GPCR cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                       of a gene that encodes cytochrome P450. The method involves using an oligomucleotide and/or a primer selected from those having sequences with at least 13 bases, including the base at position-21 in the base sequences represented by the oligos of 40-41 base pairs, or their complementary sequences, provided in the specification. The method is applicable in obtaining gene information, evaluation of drugs including safety and therapeutic efficacy, and screening drug candidates. This polymucleotide sequence represents one of the 40-41 base pair long oligos used in the gene polymorphism detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                  cytochrome P450- encoded gene obtaining gene information,
                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel method for detecting gene polymorphisms
                                                                                            polymorphism; cytochrome P450; drug evaluation; safety; single nucleotide polymorphism; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunosuppressive; immunostimulatory; antiinflammatory; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mouse; lineage restricted precursor cell; neuron-restricted precursor; NRP; glial-restricted precursor; GRP; mouse neural tube; transplantation; antibody; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is one such oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            e.g. cancer,

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its compounce, match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid further comprises and a cross-species comparison. Each of the concleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific or nucleic acids further comprises a tag sequence or specific or probes is useful in in situ hybridisation, in Southern, Northern or dotor hybridisation to identify or detect the sequence or specific or mutations of any gene, in mapping the 5' termini of mRNA molecules by containing segments of DNA that have been containing segments of DNA that have been consolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence. html
           New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New array of nucleic acid probes, useful for in situ hybridization, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ouery Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides populations of lineage-restricted precursor cells from mouse neural tube and mouse embryonic stem cells. These populations are of neuron-restricted precursor cells (NRPs) and glial-restricted precursor cells (GRPs). These cell populations are useful in the development of new transplant techniques, for transplantation in diseases where neuronal or glial degeneration has occurred, in the identification of large which enhance the survival and proliferation of transplanted cells, to identify genes specific to selected stages of development, and in the generation of cell-specific
                                                                                                                                                                                                                                                                    New pure populations of neuron- or glial-restricted precursor cells and neuroepithelial stem cells from mouse neural tubes or embryonic stem cells for developing new drugs or techniques that enhance survival of transplanted cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, or nanalysis of genetic variation or in hybridisation to a DNA library, or monounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of a least one or more nucleic acids to at least two or mace nucleic acids probes are attached to a solid support. The analysis comprises monitoring concerning members of a gene and a cross-species or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid solutions of any gene, in mapping the 5' termin of mRNA molecules by comparisons or in screening cNNA or genomic libraries or subclones containing segments of DNA that have been containing acid probes in corporated in the microarray. Note: The sequence contains a for the melance are segmented in the microarray. Note: The sequence contains and previously sequenced in the microarray.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N-acetylgalactosamine; N-acetylglucosamine; human; N-acteylglactosamine transferase; NGalNAc-T1; ss;

Bcl-2 genes are anti-apoptotic genes whose products prevent unwanted death of certain cell populations, and are useful for tracting neurodespenerative diseases such as Huntingdon's Parkinson's or Alzheimer's disease. The PCR product was ligated into retroviral vectors LNXS and LNCX, to produce retroviral vectors LNXS-bcl-2 and LNCX-bcl-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Capsule containing packaging cells that produce viral vectors for gene therapy - used as replaceable implants in treatment of cancer, atherosclerosis etc., providing localised, long-term vector delivery.
                                                                protein. The protein is useful for enzyme used in producing oligosaccharides. The inventive isolated protein has the activity of transferring N-acetylgalactosamine to N-acetylglucosamine via betal-4 linkage. The present sequence represents human N-acteylglactosamine transferase, NGalNAc-T1, PCR primer.
                                                The invention relates to an isolated N-acteylglactosamine transferase
                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     bcl-2 gene; anti-apoptotic gene; prevention; cell death; treatment; neurodegenerative disease; disease; Huntingdon's; Parkinson's; Alzheimer's; retroviral vector; LNXS; LNCX; live packaging cell; blocompatible capsule; release; viral vector; implant; gene therapy; tumour; PCR primer; amplify; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "Kozak sequence which enhances translation

                                                                                                                                                                                                    o;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a vector system, for transfection and recombinant polypeptide expression in a mammalian host cell, comprising a first cisturon encoding a transactivator protein under control of a first promoter, and a second cistron encoding an appptosis-protective protein under the control of the first promoter or optionally under the control of a second promoter, where the first and the second cistron are contained in one or more vectors. The vector system is useful for transfecting and expressing recombinant polypeptide in mammalian cells. The present sequence represents a RT-PCR primer for cloning the hamster B -cell lymphoma 2 (bcl-2) cDNA.
The vectors are used to transfect live packaging cells which form the core of a biocompatible capsule. These packaging cells are able to secrete a viral vector which includes a heterologous gene (in this case bcl-2) encoding a biologically active compound e.g. antisense sequence, blood coagulation factor, or an enzyme. The biocompatible capsules are surrounded by a jacket of permeable material with a porosity that allows release of the viral vector. The biocompatible capsules are implanted, e.g. into the central nervous system, for use in gene therapy, particularly where the active compound is useful in the treatment of tumours, cancers and other cell proliferative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protein

The invention relates to the use of a polynucleotide comprising a sequence of 3977, 2441 or 3410 base pairs, fully defined in the sequence of 3977, 2441 or 3410 base pairs, fully defined in the specification, its fragment or complement, foor diagnosis or treating contactual compound regularing the expression of the polynucleotide comprising: (a) bringing a test compound into contact with a cell capable of expressing the expression of the polypeptide in the cell, and (c) detecting the expression of the polypheptide in the cell, and (c) detecting the expression of the polypheptide in the cell, and (c) controlled to compared to a control. The polypucleotides and polypeptides are useful for diagnosing schizophremia, and for identification of subjects who are predisposed to schizophremia, and for identification of subjects who are predisposed to schizophremia, and for identification of subjects who are predisposed to schizophremia, and for evaluating the efficacy of drugs for such disorder, and monitoring the progress of patient symptoms involved in clinical trials for the progress of such disorder. This sequence corresponds to a hybridization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotides and polypeptides, useful for diagnosing schizophrenia, and for identifying a compound modulating the activity of

                                                                                                                                                                                                                                                                                                                                   This antisense oligonuclectide is complementary to the translation initiation site of the human bcl-2 mRNA. The Bcl-2 antisense oligonuclectides are phosphorothicate derivatives and can straddle strategic sites such as the translation initiation site, donor and acceptor splicing sites, or sites for transportation or degradation. Blocking translation at such strategic sites prevents the formation of a functional bcl-2 gene product. These oligonuclectides may be used for trating cancers associated with high levels of bcl-2 gene expression, especially lymphomas and some leukaemias. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                           Anti-sense oligo:nucleotide(s) complementary to BCL-2 mRNA - useful for treating cancers, e.g. lymphoma(s) and some leukaemia(s).

                                                                                                                                                                                                                                                                                                                                                                    Anti-sense oligo:nucleotide(s) complementary to BCL-2 mRNA - useful for treating cancers, e.g. lymphoma(s) and some leukaemia(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This antisense oligonucleotide is complementary to the translation initiation site of the human bc1-2 mRNA. The Bc1-2 antisense oligonucleotides are phosphorothioate derivatives and can straddle strategic sites such as the translation initiation site, donor and acceptor splicing sites, or sites for transportation or degradation. Blocking translation at such strategic sites prevents the formation of functional bc1-2 gene product. These oligonucleotides may be used for treating cancers associated with high levels of bc1-2 gene expression, especially lymphomas and some leukaemias. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

/clone_libe_Sugano mouse liver mlia"
/clone_libe_Sugano mouse liver mlia"
/note="Organ: liver; Vector: pME185-FL3; Site_1: DraIII
(CACTGTGTG); Site_2: DraIII (CACCATGTG); lst strand cDNA
was primed with an oligo(dT) primer
[ATGTGGCCTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [TGTTGGCTACTGG], digested
and cloned into distinct DraIII sites of the pME185-FL3
vector [5' site CACTGTGTG, 3' site CACCATGTG). XhoI should
be used to isolate the cDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGGG and 3' end
primer CGACCTGCAGCACA."

/note="PCN varies" in the DNA of primary transformants of Orysa sativa plants. The DNA fragment(s) resulting of PCN were directly sequenced from the left border to determine the genomic sequence flanking the insertion.

T-DNA derived sequences were removed Information to order the corresponding mutant line and a link to a datebase providing a graphical display is available from june 2004 at http://genoplante.info.infobiogen.fr/oryzatagline/.

This sequence has been generated in the framework of the French plant genomics program Genoplante (http://www.genoplante.org and http://genoplante.org and http://genoplante.org and http://genoplante.info.infobiogen.fr)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Contact: Robert Strausberg, Ph.D.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwm742 (gil4732114 gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
